Clinical pharmacology is now a well established discipline. Unlike the yester years when dosage schedules were determined by trial and error, in the present day selection of dose, dosage interval and route of administration are based on pharmacokinetic and pharmacodynamic principles. The primary utility of pharmacokinetics is to study the process of absorption, distribution, metabolism and elimination of drugs, fundamental for drug action. Basic pharmacokinetics. PK is an important tool when conducting both basic and applied research and is an essential component of the drug development process. PK is a valuable adjunct for prescribing and evaluating drug therapy. The rationale for measuring concentrations of drugs in plasma, serum, or blood is that concentration-response relationships are often less variable than dose-response relationships.

Pharmacokinetics (from Ancient Greek pharmakon "drug" and kinetikos "moving, putting in motion"; see chemical kinetics), sometimes abbreviated as PK, is a branch of pharmacology dedicated to determine the fate of substances administered to a living organism. The substances of interest include any chemical xenobiotic such as: pharmaceutical drugs, pesticides, food additives, cosmetics, etc. It attempts to analyze chemical metabolism and to discover the fate of a chemical from the moment that it is By Michael E.
