Children's Emotions and Moods by Michael Lewis, 9781461336228, available at Book Depository with free delivery worldwide. From a developmental perspective, Piaget and his followers have articulated a complex theory of transition and change in intellectual behavior. Nearly a century ago, Freud proposed an elaborate theory of personality development in which some aspects of emotional growth were considered. We await the construction of a comprehensive theory of emotional development. Recognizing such a need, we set out over a decade ago to solve what seemed to be a relatively simple problem: By observing young children, could one successfully classify children in terms of individual differences on emotional dimensions? Nine fundamental domains of children's emotion regulation were found, interpreted as Outward Engagement, Inward or Somatic Focus, Disengagement, Disruptive, Impulsive/Labile, Social Connectedness/Compliance, Generating Closeness/Intimacy, Establishing Order and Generating Disorder. Individual scores across these nine domains were clustered to generate five summary Profiles of children's emotion regulation. Emotion regulation is an important component within the developmental psychopathology premise (Cole, Michel, & Teti, 1994). (1884). Prior to James's theory, it was believed that emotions arose following the perception of an emotion-eliciting event.
